

Terms of Reference For

Design, Development and Implementation of Management Information System of the Sri Lanka Accounting and Auditing Standards Monitoring Board (SLAASMB) – (ICTA/GOSL/CON/QCBS/2016/26)

1. Introduction

Requirement for a Centralized Management Information System for Sri Lanka Accounting and Auditing Standards Monitoring Board (SLAASMB) has arisen due to unavailability of a software solution for their operations at present. A centralized solution improves the evidence based decision making process in relation to their monitoring activities. An effective and efficient decision making is one of the key factors for a productive government service delivery process and ensures a good governance model.

SLAASMB is the main stakeholder of this Centralized Management Information System. In addition Ministry of Finance, Institute of Chartered Accountants of Sri Lanka, Department of Registrar of Companies and Auditor General's Department are identified as the other stakeholders involved in this project.

2. Background

SLAASMB was established under the Sri Lanka Accounting and Auditing Standards Act No. 15 of 1995. Based on the definitions and criteria laid down by the Act, certain institutions are identified as specified business enterprises (SBEs). These include all quoted companies, companies carrying on business which are important for the purpose of monitoring (such as banking, finance, insurance, and leasing), other large companies (Public and Private), and Public Corporations engaged in the provision of goods and services. These institutions are required to comply with Sri Lanka Accounting Standards and the auditors of such enterprises are required to comply with Sri Lanka Auditing Standards. The Act requires such enterprises to submit their annual audited financial statements to SLAASMB to enable SLAASMB to monitor compliance with Sri Lanka Accounting Standards and Sri Lanka Auditing Standards.

SLAASMB carries out its functions by reviewing financial statements received, reviewing audits and conducting investigations on failure to comply with standards and taking appropriate corrective action with regard to deviations from standards by SBEs and auditors. In order to facilitate its functions, SLAASMB provides financial assistance by way of an annual grant to the Institute of Chartered Accountants of Sri Lanka for setting standards, and maintains relations with relevant international organizations.

The SLAASMB is empowered to call for documents, information and explanations from Directors and Managers of SBEs and Auditors of SBEs for the purpose of carrying out its functions. Where Financial Statements have not been prepared in accordance with Sri Lanka Accounting Standards, the SLAASMB could require an enterprise to make suitable corrections.

The Board has the power to compound an offence for a sum of money not exceeding 1/3 the maximum fine. In cases where noncompliance was done deliberately to mislead the public the courts may impose penalties extending up to 5 years imprisonment.

3. Concise statement of the Objectives

The project intends to study the requirement, design and develop the system, deploy and maintain the system.

The consultant firm (Software development firm) is required to gather requirement, design, develop and implement the software, which will be delivered to SLAASMB.

The total duration of the assignment, including requirement gathering, designing, developing and final deployment was 8 months, which include perioding user training and DEMO's.

4. Scope of Work

1. Conduct a detailed system requirement study of the processes
2. On completing the above, submit a detailed requirement software specification (DSRS).
3. Design and develop the system, upon obtaining ICTA's & SLAASMB's approval for the above.
4. Collaborate with the 'Software Process Audit (SPA)' consultants appointed by ICTA, or review committee and facilitate the 'SPA' appointed by ICTA. Refer Annex C
5. Prepare detailed system design and architecture
6. Maintain project source code in the ICTA Source Code Management (SCM) system.
7. Maintain all issues in the Issue tracking system maintained by ICTA.
8. Adopt a proper application release procedure to release the SLAASMB MIS to ICTA during the deployment in the staging / production environments.
9. Participate for Project Review Committee meetings and Project Implementation Committee (PIC) Meetings as a member
10. Obtain User Acceptance Test (UAT) for the implemented processes.
11. Deploy into production environment at Lanka Government Cloud (LGC).
12. Provide support and maintenance services, from the date of launch to an agreed time period.
13. Adhere to the Service Level Agreement (SLA), during the support and maintenance phase indicated in Annex B.
14. Adherence to e-Government Policy of Sri Lanka.
15. Adherence to Web 2.0 concepts, open standards and Service Oriented Architecture (SOA) principles.
16. Work collaboratively with ICTA and other stakeholder organizations
17. Followings are the functional requirements at high level (Table of the High level functions)

Module	Task	Description
Generate Receipts Module	Generate Receipts	Receipts with unique Receipt no
	Update Receipt Register	List of financial statements received with the year of financial statements, Receipt date and Receipt number

	Maintain Database of financial information on SBEs	Key data , graphs, comparisons, ratios
	Maintain database with market data of listed entities	Market price, Market Capitalization
	Alert pending financial statements	List of SBEs which had not submitted financial statements for a specific period
	Error reports	Duplicate financial statements received, financial statements from non SBEs received
	Generate reminders to SBEs	History of reminders, Status of reminders
	Alert new SBEs	History of submission of financial statements (SBE wise)
	Obtaining financial statements in softcopy form (if available)	Financial Statements of SBE's
	Identification of Financial Statements due to be lapsed	List of SBE's based on receipt date which have not been reviewed and are due to be lapsed.
	Other Information on Financial Statement	Lists of categories of SBEs (BNK, FNN, EXL etc...)
		SBEs adopting SME standards, full IFRS
		Whether the company is a Holding company and if so, subsidiaries and associates of the group (ability to attach group structures)
		Whether financial statements received are consolidated or not
		Review status of the reports received, risk category, review started or not, with external reviewer, name of the TM /ATM / External Reviewer, date of commencement of review, If a TM/ATM cannot review a particular financial statement, reason for inability (conflict of interest)
		Status of the pending reviews, pending information, observations to write
		History report including receipt number, date of receipt, Company Name, Category: (LST, BNK), Risk category, Whether Group of

		companies, assigned reviewer, Current status, previous financial reports submitted to SLAASMB, previous F/S reviewed by SLAASMB, previous letters issued by SLAASMB, Previous review results
		Report of ratio analysis of a company if at the receipt point the Total assets, Equity, Revenue, PAT is entered in the system.
		Materiality Template to be auto generated if at the receipt point the Total assets, Equity, Revenue, PAT is entered in the system.
		List of relationships among companies, (Identifying parent, subsidiary, associates relationships) and Non compliances and name of directors /Auditors
		Ageing of reports as at a given date.(So that outstanding reports can be analyzed with the age bucket)
		Alert files due to be lapsed within 2 months Identify SBE's with qualified, adverse , disclaimer audit opinion
Financial Statement reviews	Maintain information on past financial statement reviews	Past observations year wise Past data of financial statements of each SBE with repeated observations Past Observations Group wise analysis History of undertakings obtained History of directions issued Graphical presentations Analysis of comfort letters sent (company wise) - No. of comfort letters sent previously to one particular SBE Agreements undertaken
	Maintain information on present reviews	Observations during the current year company wise Analysis of reviews based on categories (e.g. banks, finance companies, etc.) Allocate Financial Statement to TM/ATM based on a risk criteria Whether there is any follow up notes and the year in which those to be followed up Agreements undertaken historical

	Maintain a folder on standard wordings to use in letters on non-compliances	List of Standards violated based on frequency of occurrence and effective date and year end
	Maintain folder of formats of documents	Analysis of reviews based on reviewer/ATM/TM
	Maintain information on external reviewers	Status of reports given to external reviewers- date given, date received, allocated TM History of reviews of external reviewers – reviewers wise Allocate risk based identification to reviewers
	Alert when the same observation had been communicated twice to one particular SBE	
	Alert on related parties of the board	List of related parties and relationship
	Alert on follow up notes	Information on undertakings obtained and directions issued and subsequent review and whether undertaking was completed Major issues/agreements undertaken to be followed up in the next year Agreements undertaken
	Contact details of SBEs (Co name, Contact person and tel numbers)	Data of persons and the contact information
	Identification of Manager in Charge	Names of Head of Finance, contact number
	Historical Information	History Report (Name of the Company, Name of the Group, Date received, Receipt number, Year, Asset, Liabilities, Equity, Revenue, Profit after tax, Assigned Preliminary reviewer, Date of review, Assigned Manager, Date of Completion, Type of letter sent, Number of Disclosure Issues, Number of measurement issues ,Value of measurement issues, Standard reference of noncompliance, Follow up notes, Whether Audit review has been done, Date of the Audit review, change in Auditor, financial strength of SBE considering market capitalization and or total assets with the related auditor) Observations communicated to subsidiaries in the same financial year (to consider when finalizing review of the parent)
	News / Important Published Notifications	Ability of attaching important findings (i.e. newspaper articles, CSE notices, SEC directions) to the individual company & to the group structure, Maintaining a folder for each

		company which has a higher risk (PLCs, Banks & Finance Companies) to update external news which are relevant for F/Ss reviews
	Technical Committee – Alert	Ability of generating technical memos in respect of important technical issues that are to be presented to the technical committee & ability of updating the same memo based on technical committee decisions. Ability of viewing those by subject.
		Reports on important conclusions made by the technical committee (i.e. issue, conclusion, basis, standard reference, members participated, Date)
		Sector wise important issues identified during the year together with the technical file references
		Narration on the issue and the outcome with technical reference
Audit reviews	Maintain information on past audit reviews	Past observations year wise
	Maintain information on present audit reviews	Observations SBE wise, auditor, audit partner
	Maintain a folder on standard wordings to use in letters on non-compliances	Formats of letters.
	Maintain folder of formats of documents	List of auditing standards violated based on frequency of assurance
		Analysis of audit reviews based on TM/ATM, total reviews completed per annum
	Maintain Database of Auditors	Observations analyzed based on firm, size of firm, audit partner.
		List of SBEs not subjected to audit reviews
		List of audit firms not subjected to audit reviews
		Plan of Audit Reviews, year wise plan of audit firm reviews.
		Analysis of observations based on firms
		Improvements in firm-wise reviews (comparison of review finding for the first 5 years)
		Graphical presentations

		Status of audit reviews- tentative sent, final sent, waiting for info
		Follow up of auditors
		A firm wise report of Quality control indicators (Name of the firm, List of SBES, Number of partners, Number of staff, Issues in Media, Etc..)
		Narration on the issue and the outcome with technical reference
Meetings	Maintain information on meetings with auditors (other than audit reviews)	Meetings held with auditors and the purposes, meeting references.
	Maintain information on meetings with companies	Meetings held with companies and the purposes Meetings held on investigations Meetings held on inquiries Meetings on references Number of times the firm and the auditor (Individual) has attended the meetings during a given year(Date, Name of the Firm, Name of participants, Type of meeting, Company reviews LST, Bank etc)
	Conducting Technical meetings	Details of technical meetings and minutes/ outcome of the meeting, statement obtained
	Maintain information on Complaints	Conclusions reached after having the meetings held with auditors/companies, Number of such meetings
Training	Maintain records on past training programs	Training program, Date of program, Period of program official who attended Outcome of the training programs Feedback on program
	Maintain records on present training programs	Participants for the training programs Date of program, Period of program Outcome of the training programs Feedback on program
	Maintain folder of formats of reports	Learnings of the outcomes of training programs
	Maintain folder of PowerPoint presentations/Past Reports	Up-to-date presentations on accounting and auditing standards

		History of training programs including how the program was sourced, (date of attendance, Name of participant, Technical/Non-technical training, Manager/Assistant manager/Non-technical staff attending, recurring/non recurring, cost incurred, Hours of training, Date of presentation done by the participant, total points allocated, Special comments)
		Copies of important technical presentations done by staff, technical publications and information obtained from third parties by the SLAASMB (i.e. clarification obtained from inland Revenue), Valuation Guidelines
	Log on to possible training programs	Total cost incurred during the year for training, per person cost.
	Training contacts	Name of program, date of program, presentation, contact details, recommendation by staff attendees.
Legal Proceedings	Maintain records on past legal proceedings	History of legal actions/ Clarifications taken against companies (company wise and subject wise) from Attorney General History of legal action made against auditors (firm wise and subject wise)
	Maintain records on present legal proceedings	Present status of the legal actions, allocated attorney, date of handing over
	Matters referred to Attorney General	History of Legal clarifications requested Matters pending with Attorney General Allocated attorney, contact details, date of handing over to attorney general.
Valuation database	Data values of land Valuation (Location, basis, extent, Valuer, Asset type)	Details including company name, property details and valuation method details, Value Softcopy of valuation report
	Matters referred to Chief Valuer	Property values - Location wise, per perch value, extent, company name, Industry
Board members	Maintain records of Board Members	List of Board Members, Date of appointment, Date of registration.
		Qualification, present employer, designation. Their relationship with SBEs / Auditors Experience category, sub-committee of SLAASMB served.
Performance Records	Maintain individual performance records	Performance records of the individuals linked with the Financial Statement reviews and Audit review databases with ability to include any other work

18. Detailed requirements relating to above processes are documented in Annex C
 19. Refer following Annexes which form a part and partial of the “Terms of Reference”.

Annex A - Non-Functional Requirements

Annex B - Service Level Agreement (SLA) for Support and Maintenance Services

Annex C - Software Project Audit Process Functions

Annex D - High level functional requirements

5. Final outputs, Reporting Requirements, Time Schedule for Deliverables;

Project duration is 8 months including detailed requirement study, designing, developing and deploying the system.

Consultancy firm is required to submit the following list of deliverables for the MIS of SLAASMB.

No	Deliverables	Phase
5.1	Implementation Proposal 5.1.1 Inception report 5.1.2 Requirement verification report 5.1.3 Implementing schedule 5.1.5 Acceptance criteria for the UAT 5.1.7 Proper maintenance of issues in the Issue tracking System	Inception
5.2	5.2.1 Design and Architecture Document 5.2.2 Data migration and integration plan (if applicable) 5.2.3 Release Management plan (including staging, production and support and maintenance) 5.2.4 Proper maintenance of issues in the Issue tracking System	Elaboration
5.3	5.3.1 Iteration one release note 5.3.2 Iteration two release note 5.3.3 Iteration three release note 5.3.4 Proper maintenance of source code in SCM for all three iterations 5.3.5 Proper maintenance of issues in the Issue tracking System	Construction
5.4	5.4.1 Solutions deployment and installation guide 5.4.2 Online help and the User manual for back office application 5.4.3 Administrator Manual 5.4.4 Proper maintenance of issues in the Issue tracking System 5.4.5 Successful UAT acceptance of the system 5.4.6 Production deployment confirmation report	Transition

Refer http://en.wikipedia.org/wiki/IBM_Rational_Unified_Process for more information about RUP (Rational Unified Process) phases.

6. Qualifications of the key consultants

Preferable Minimum Qualifications:

- **System implementing team**

Key Professional Staff	Academic Qualification	Experience in the <u>PROPOSED ROLE</u>	Experience in working in SOA / web services / integration projects	Exposure SQA Process
Project Manager	B. Sc or equivalent	5 years	2 years	2 years
Software Architect	B. Sc or equivalent	3 years	2 years	2 years
Technical Lead	B. Sc or equivalent	2 years	1 years	2 years
Business Analyst	B. Sc or equivalent	3 years	1 years	2 years
Quality Assurance Lead	B. Sc or equivalent	2 years	1 years	2 years
Software Engineer	B. Sc or equivalent	2 years	1 years	1 years
UI Lead	B. Sc or equivalent	3 years	2 years	1 years
UI Engineer	B. Sc or equivalent	2 years	1 years	1 years
QA Engineer	B. Sc or equivalent	2 years	1 years	1 years
DB Specialist	B. Sc or equivalent	3 years	2 years	1 years
IS Security Specialist	B. Sc or equivalent	3 years	1 years	1 years

- **Support and Maintenance team**

Key Professional Staff	Academic qualification	Experience in the <u>PROPOSED ROLE</u>	Experience in working in SOA / web services / integration projects	Exposure SQA Process
Technical Lead	B. Sc or equivalent	2 years	1 years	2 years
Software Engineer	B. Sc or equivalent	2 years	1 year	1 year

7. Services and Facilities Provided by ICTA

- 7.1 Web-based access to the ICTA SCM system
- 7.2 Designs of the existing system
- 7.3 Access to staging/ production servers
- 7.4 Issue Tracking System

8. References

- [1] e-Government Policy Approved by Cabinet of Sri Lanka <http://www.icta.lk/index.php/en/e-gouvernement-policy>
- [2] Lanka Interoperability Framework - <http://www.life.gov.lk/>

9. Review Committees and Review Procedures

The Software Development Service Provider is required to work closely with the ICTA Technology Team and the Software Process Audit (SPA) consultants or the review committees such as SAGE – Software Architecture Group of Experts.

All versions of deliverables will be reviewed by/either the SPA consultants, SAGE, or ICTA Technology Team.

All the deliverables must be verified and confirmed to be accurate and complete by the Project Implementation Committee (PIC) or the Project Management Committee (PMC). Deliverables must be formally endorsed by the PIC or PMC or CTO or Head of Technology Team.

Annex (A)

Non-Functional Requirements

1. Workflow based operations

A workflow is activated when an initiating event occurs. The workflow would guide a user in actioning an event. It would define the requirements to initiate a workflow. Once initiated, the processing should be controlled as to the sequence of activities, and the officers who execute it.

Some key terms and concepts of workflow based operations are:

- **Task:** Work performed to effect a single change. A workflow would consist of several tasks. In workflow construction, the task definition is a template for action. The task must be associated with an actual event in order to carry out the action.

- **Activated Task:** When an action is required, and a task is associated with a specific item which must be actioned, the task is instantiated and a single instance of the task is created. It is the instance of a task (ie- Activated Task) which can be executed. (Note: This is not a standard workflow term, and has been adopted for clarity).

- **Work Item:** A workflow-item moving through a work process. A work item would be associated with a single instance of a workflow, and Activated Tasks within the workflow.

Refer Annexure A1.1 for more supporting services

2. Security

1. User authentication and authorization

An administrative application need to be developed wherever applicable.

2. Availability

The system should be developed to ensure “High Availability” to remain the system available all the time. (E.g. Portlets clustering capability should be taken into consideration in the development)

3. Non-repudiation

The system should ensure non-repudiation by having standard audit-trails and provisions to have WS-Security using digital signatures.

3. Audit Facilities

Wherever applicable, an audit trail of all activities must be maintained. On a service or operation being initiated, the system should log the event, creating a basic ‘audit log entry’. It should not be possible for the operation to be executed without the log entry being made.

The information recorded in the audit trail depends on the type of activity which takes place. Each service would be responsible for logging detailed information. The different types of operations are -

1. Data Capture & Maintenance
2. Creation of an entry / item
3. Modification of an item
4. Deletion
5. Control (or status change)
6. Process execution
7. Data synchronization
8. Print (only selected item)
9. Retrieval
10. Monitor

Detail logging may be enabled or disabled for each type of operation, and/or for each business object. It should be possible to configure which attributes of a data item should be traced at the detail level. Tracing

of some attributes may be considered mandatory, and they should not be turned off.

4. Backup and Contingency Planning

The main contingencies that should be considered and the training with regards to these shall be given to the relevant staff -

11. Equipment failure
12. Physical / natural Disaster
13. Messaging or communication facilities.
14. Changes in operations and policy
15. Sudden absence of key personnel
16. Breach in Security

Automatic Backups daily, weekly and monthly should be taken. All the backup procedures and backups needs to be tested regularly for restoration.

5. Performance

Following performance criteria is provided as a guideline only. If the actual performance is falling below the stipulated figures, the consultant is to justify the reasons. However, the performance level must be accepted by the technical evaluation committee appointed by the client.

The bandwidth is assumed at 512kbps (shared) 20 concurrent users (50% load factor) in total.

Item	Performance
Screen Navigation: field-to-field	< 10 milliseconds
Screen Navigation: screen-to-screen	< 5 seconds
Screen Refresh	< 3 seconds
Screen list box, combo box	< 3 seconds
Screen grid – 25 rows, 10 columns	< 5 seconds
Report preview – (all reports) – initial page view (if asynchronous)	< 60 seconds in most instances. It is understood that complicated / large volume reports may require a longer period
Simple enquiry – single table, 5 fields, 3 conditions – without screen rendering	< 5 seconds for 100,000 rows
Complex enquiry – multiple joined table (5), 10 fields, 3 conditions – without screen rendering	< 8 seconds for 100,000 rows
Server side validations / computations	< 10 milliseconds
Client side validations / computations	< 1 millisecond
Batch processing (if any) per 100 records	< 120 seconds
Login, authentication, and verification	< 3 seconds
Daily backups (@ Dept.) – max duration	1 hour (on-line preferred)
Total Restore (@Dept) – max duration	4 hours

Annex (B)

SERVICE LEVEL AGREEMENT *for* SUPPORT AND MAINTENANCE SERVICES

1. Introduction

The aim of this agreement is to provide a basis for close co-operation between the Client and the Consultant for support and maintenance services to be provided by the Consultant, thereby ensuring a timely and efficient support service is available. The objectives of this agreement are detailed in Section 1.1.

This agreement is contingent upon each party knowing and fulfilling their responsibilities and generating an environment conducive to the achievement and maintenance of targeted service levels.

1.1 Objectives of Service Level Agreements

1. To create an environment conducive to a co-operative relationship between Client, Consultant and Client's representatives (government organizations) to ensure the effective support of all end users.
2. To document the responsibilities of all parties taking part in the Agreement.
3. To define the commencement of the agreement, its initial term and the provision for reviews.
4. To define in detail the service to be delivered by each party and the level of service expected, thereby reducing the risk of misunderstandings.
5. To institute a formal system of objective service level monitoring ensuring that reviews of the agreement is based on factual data.
6. To provide a common understanding of service requirements/capabilities and of the principals involved in the measurement of service levels.
7. To provide for all parties to the Service Level Agreement a single, easily referenced document which caters for all objectives as listed above.

1.2 Service Level Monitoring

The success of Service Level Agreements (SLA) depends fundamentally on the ability to measure performance comprehensively and accurately so that credible and reliable information can be provided to customers and support areas on the service provided.

Service factors must be meaningful, measurable and monitored constantly. Actual levels of service are to be compared with agreed target levels on a regular basis by both Client and Consultant. In the event of a discrepancy between actual and targeted service levels both Client and Consultant are expected to identify and resolve the reason(s) for any discrepancies in close co-operation.

Service level monitoring will be performed by Client. Reports will be produced as and when required and forwarded to the Consultant.

1.3 Support Levels

The consultant must provide support and maintenance services during Support Levels mentioned below;

Support Level: **High**

Component/ Service	Core Components of Lanka Gate
Support Hours	24 hours a day, all days in the week (including public and mercantile holidays)

Support Level: **Medium**

Component/ Service 1	Government Interface and related backend services (deployed at Government organization site)
Support Hours	From 08:00 AM to 05:00 PM Monday to Friday

(excluding public holidays)

Component/ Service 2	For front-end portlets and supporting back-end applications (web services, etc.. deployed at Lanka Government Cloud (LGC))
Support Hours	From 08:00 AM to 09:00 PM, all days in the week (including public and mercantile holidays)

1.4 On-Call Services Requirements

Consultant MUST make at least ONE qualified personnel available to the Client by telephone and email for the reporting and resolution of non-conformities or other issues, defects or problems. Dedicated telephone numbers and emails should be available for reporting issues. Client will nominate the personnel who are authorized to report non-conformities or other problems with the system from the departments. Reporting of non-conformities includes requests by the Client to apply critical software updates or patches.

Table-1 shows the response priority assigned to faults according to the perceived importance of the reported situation and the required initial telephone response times for the individual priority ratings. All times indicated represent telephone response time during specified Support Levels. The indicated telephone response time represents the maximum delay between a fault/request being reported and a Consultant's representative contacting the Client by telephone. The purpose of this telephone contact is to notify the Client of the receipt of the fault/request and provide the Client with details of the proposed action to be taken in respect of the particular fault/request.

Support Level	Business Critical	Business Critical	Non-Business Critical	Non-Business Critical
	Fatal	Impaired	Fatal	Impaired
High	60 minutes within Support Hours	90 minutes within Support Hours	90 minutes within Support Hours	120 minutes within Support Hours
Medium	120 minutes within Support Hours	150 minutes within Support Hours	150 minutes within Support Hours	180 minutes within Support Hours

Table-1: Response Priority

Note:

- Fatal - Total system inoperability
- Impaired - Partial system inoperability
- Business Critical - Unable to perform core business functions
- Non-Business Critical - Able to perform limited core business functions

Consultant notification can occur outside Support Level time, and thus the response may occur after the next Support Level begins. Furthermore, "Time to Arrive On-Site (Table-3)" starts from Support Level starting time and "Time to Resolve the Problem" is Support Level time starting from the actual time of arrival on site.

1.5 Problem Resolution and Penalties

If problems have not been corrected within two (2) hours of the initial contact, the Consultant shall send qualified maintenance personnel to the respective Client's site to take necessary actions to correct the issue reported (defect, problem or non-conformity).

If faults are not corrected within the time limits specified in the Table-2, the Client shall be entitled to a penalty payment for each hour that the Consultant fails to resolve the fault.

Maximum ceiling of penalty for a given month is 10% of the monthly support and maintenance price.

The time to arrive on-site is specified in the Table-3.

Support Level	Business Critical	Business Critical	Non-Business Critical	Non-Business Critical
	Fatal	Impaired	Fatal	Impaired
High	6 Hours LKR 5,000.00 per hour	10 Hours LKR 3,000.00 per hour	10 Hours LKR 3,000.00 per hour	15 Hours LKR 2,000.00 per hour
Medium	8 Hours LKR 5,000.00 per hour	12 Hours LKR 3,000.00 per hour	12 Hours LKR 3,000.00 per hour	20 Hours LKR 2,000.00 per hour

Table-2: Resolution Time and Penalties

Support Level	Business Critical	Business Critical	Non-Business Critical	Non-Business Critical
	Fatal	Impaired	Fatal	Impaired
High	Not applicable	Not applicable	Not applicable	Not applicable
Medium	2 Hours	3 Hours	3 Hours	5 Hours

Table-3: Time to arrive on-site

Software Project Audit Process

Version 1.2

Information and Communication Technology Agency of Sri Lanka

Introduction

1.1 Purpose

Purpose of this document is to describe the Software Project Audit Process which is capable of auditing and ensuring the quality of different activities carried out throughout a software project life-cycle. The main purpose of this process is to provide much higher level of confidence in the quality of the deliverables received by the client from the developer. The quality level of the audited activity is presented using a measurement technique called metrics.

The process should be followed by both the development team and the Software Project Audit team to derive their own metrics to measure the quality status of a software product in its life cycle. Eventually, the trend analysis of such metrics can be used to identify any potential project issues or failures and to come up with solutions.

This document explains several guidelines which can be used within the audit process for project progress calculation and mapping payment milestones with project deliverables or and project artifact reviews to effectively manage the project.

Further, the document contrasts the Software Project Audit process from typical software development life cycle and illustrates how it has been automated by integrating several testing tools and testing methodologies as well as embedding best industry standards.

1.2 Scope

Scope of this document is to provide an insight about the Software Project Audit Process, importance of metrics, analysis of metrics, automated process of metric generation, skills required to generate certain metrics, guideline for project progress calculation, guideline for mapping payment milestones with deliverables and guideline for Review of Project artifacts.

1.3 Definitions, Acronyms and Abbreviations

Acronym	Definition
AQI	Architecture Quality Index
AD	Architectural Design
CQI	Code Quality Index
DD	Defect Density
DQI	Design Quality Index
DSI	Defect Severity Index
ISI	Issue Severity Index
PERI	Project Execution Readiness Index
RCI	Requirement Clarity Index
SPA	Software Project Audit
SR	Software Requirement
TTEI	Tasks Tracking Efficiency Index
TR	Transfer
UAT	User Acceptance Test
OAT	Operational Acceptance Test

2. Process Overview

It is often said that if something cannot be measured, it cannot be managed or improved. There is immense value in measurement, but you should always make sure that you get some value out of any measurement that you are doing.

What is a Metric?

It is a standard of measurement which can be used to measure the software quality. It gives a confidence in the software product. They are typically the providers of the visibility of the software product you need.

Why Measure?

When used appropriately, metrics can aid in software development process improvement by providing pragmatic, objective evidence of process change initiatives. Although metrics are gathered during the test effort, they can provide measurements of many different activities performed throughout a project. In conjunction with root cause analysis, test metrics can be used to quantitatively track issues from points of occurrence throughout the development process. In addition, when metrics information is accumulated, updated and reported on a consistent and regular basis, it ensures that trends can be promptly captured and evaluated.

What to Measure?

When considering the metric driven process, it can be divided into two parts. The first part is to collect data, and the second is to prepare metrics/charts and analyze them to get the valuable insight which might help in decision making. Information collected during the software development process can help in:

- Finding the relation between data points
- Correlating cause and effect
- Input for future planning

Normally, the metric driven process involves certain steps which are repeated over a period of time. It starts with identifying what to measure. After the purpose is known, data can be collected and converted into the metrics. Based on the analysis of these metrics appropriate action can be taken, and if necessary metrics can be refined and measurement goals can be adjusted for the better. Data presented by Development/testing team, together with their opinion, normally decides whether a product will go into client or not. So it becomes very important for Development team/test teams to present data and opinion in such a way that data looks meaningful to everyone,

and decision can be taken based on the data presented. Every software project should be measured for its schedule and the quality requirement for its release. There are lots of charts and metrics that we can use to track progress and measure the quality requirements of the release. In Figure 1.0 shows some of main metrics which can be derived at specific level of the software development life-cycle.

Figure 1.0 - Various Metrics derived at different levels of SD process

2.1 Metrics in Brief

Metric	Purpose
<p>Project Execution Readiness Index (PERI)</p>	<p>This Proposed index at requirements stage is derived based on quality of the documents involve with this phase. The main Documents involve in this phase are;</p> <ul style="list-style-type: none"> * User Requirements Document * Acceptance test plans * Project management plan for the SR phase * Configuration management plan for the SR phase * Verification and validation plan for the SR phase * Quality assurance plan for the SR phase <p>When reviewing , reviewers can verify the document by checking its content with a checklist. Each of these content in a checklist is categorized under their Severity to the System. All defects in those contents should be logged in a defect tracking system. Finally, index can be derived as;</p> <p>Weighted average of the total number of Open Issues in the product detected till date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p> <p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2+ T)*10}{\text{Total weight (162+54+18+6+2+1)}}$</p> <p>Note: Can be calculated based on the review cycles</p>
<p>Requirements Clarity/Change Index(RCI)</p>	<p>This index measures following two criteria relevant to requirements</p> <ol style="list-style-type: none"> 1. Requirements Clarity <p>This is the proposed index is at Specification Stage which should indicate how well each member of the Software development team comprehend the requirements and also indicates How well the requirements are cleared for Software Development Team.</p> <ol style="list-style-type: none"> 2. Requirement Changes <p>Requirement changes may be arisen at any stage of a project. Therefore, this index should be continued till UAT phase of a project and all the requirement changes arisen during that period should be captured under this index.</p> <p>The index indicates, weighted average of the total number of Open Issues in the product detected till date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p>

	<p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10}{Total\ weight\ (162+54+18+6+2+1)}$</p> <p>Note: Can be calculated based on the review cycles.</p>
Architectural Quality Index (AQI)	<p>Testing indicator for Architectural design level. The main documents of the AD phase are;</p> <ul style="list-style-type: none"> *Architectural Design Document (ADD); *Software Project Management Plan for the DD phase (SPMP/DD) *Software Configuration Management Plan for the DD phase (SCMP/DD) *Software Verification and Validation Plan for the DD Phase (SVVP/DD) *Software Quality Assurance Plan for the DD phase (SQAP/DD) *Integration Test Plan (SVVP/IT) <p>When reviewing , reviewers can verify the document by checking its content with a checklist. Each of these content in a checklist is categorized under their Severity to the System. All defects in those contents should be logged in a defect tracking system. Finally, index can be derived as;</p> <p>Weighted average of the total number of Open Issues in the product detected till date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p> <p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10}{Total\ weight\ (162+54+18+6+2+1)}$</p> <p>Note: Can be calculated based on the review cycles</p>
Design Quality Index (DQI)	<p>This is the Index proposed at Detailed Design Level.</p> <p>Should define a quality index (DQI) to measure and evaluate the quality of the Detailed Design based on the quality of the documents involve with the Detailed Design phase. The main documents of the AD phase are the;</p> <ul style="list-style-type: none"> *Detailed Design Document (DDD) *Software User Manual (SUM) *Software Project Management Plan for the TR phase (SPMP/TR) *Software Configuration Management Plan for the TR phase (SCMP/TR) *Software Quality Assurance Plan for the TR phase (SQAP/TR) *Acceptance Test specification (SVVP/AT) <p>When reviewing , reviewers can verify the document by checking its content with a checklist. Each of these content in a checklist is categorized under their Severity to the System. All defects in those contents should be logged in a defect tracking system. Finally, index can be derived as;</p> <p>Weighted average of the total number of Open Issues in the product detected till</p>

	<p>date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p> <p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10}{\text{Total weight (162+54+18+6+2+1)}}$</p> <p>Note: Can be calculated based on the review cycles</p>
Code Quality index (CQI)	<p>- Indicates how well the software codes are written and maintained.</p> <p>- To be derived using considering multiple aspects. This will be decided in project execution.</p> <p>- Index can be derived as;</p> <p>Weighted average of the total number of Open Issues in the product detected till date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p> <p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10}{\text{Total weight (162+54+18+6+2+1)}}$</p>
Defect Density (DD)	<p>- Number of defects per unit size of the application (KLOC)</p> <p>- Calculated end of each drop cycle.</p> <p>- The Number of Known Defects is the count of total defects identified against a particular software entity, during a particular time period</p> <p>- Size is a normalizer that allows comparisons between different software entities (i.e modules, releases, products). Size is typically counted either in Lines of Code or Function Points.</p>
Defect Severity Index (DSI)	<p>- Indicates application stability</p> <p>- Weighted average of the total number of Open Defects in the product detected till date against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p> <p>Metric: $\frac{(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10}{\text{Total weight (162+54+18+6+2+1)}}$</p> <p>Note: Calculated weekly and delivered by drop</p>
Issue Severity Index (ISI)	<p>During the User Acceptance Test(UAT) time issues can be arisen. All those issues should be logged in UAT documentation as well as in the bug tracking System.</p> <p>- Weighted average of the total number of Open issues in the product arisen during the UAT period against all categories (Blocker (B), Critical (C), Major (Ma), Normal (N), Minor (Mi), Trivial(T)).</p>

	<p>Metric: $(B*162 + C*54 + Ma*18 + N*6 + Mi*2 + T)*10$</p> <p>Total weight (162+54+18+6+2+1)</p>
Defect Category	<p>attribute of the defect in relation to the quality attributes of the product. Quality attributes of a product include functionality, usability, documentation, performance, installation, stability ,compatibility , internationalization etc. This metric can provide insight into the different quality attributes of the product. This metric can be computed by dividing the defects that belong to a particular category by the total number of defects.</p>
Defect Cause Distribution Chart	<p>This chart gives information on the cause of defects.</p>
Defect Distribution Across Components	<p>This chart gives information on how defects are distributed across various components of the system.</p>
Defect Finding Rate	<p>This chart gives information on how many defects are found across a given period. This can be tracked on a daily or weekly basis.</p>
Defect Removal Efficiency	<p>The number of defects that are removed per time unit (hours/days/weeks). Indicates the efficiency of defect removal methods, as well as indirect measurement of the quality of the product. Computed by dividing the effort required for defect detection, defect resolution time and retesting time by the number of defects. This is calculated per test type, during and across test phases.</p>
Effort Adherence	<p>As % of what is committed in contract. Provides a measure of what was estimated at the beginning of the project vs. the actual effort taken. Useful to understand the variance (if any) and for estimating future similar projects.</p>
Number of Defects	<p>The total number of defects found in a given time period/phase/test type that resulted in software or documentation modifications. Only accepted defects that resulted in modifying the software or the documentation are counted.</p>
Review Efficiency	<p># of defects detected /LOC or pages reviewed per day</p>
Test Case Effectiveness	<p>The extent to which test cases are able to find defects. This metric provides an indication of the effectiveness of the test cases and the stability of the software. Ratio of the number of test cases that resulted in logging defects vs. the total number of test cases.</p>
Test Case Execution Statistics	<p>This metric provides an overall summary of test execution activities. This can be categorized by build or release, module, by platform (OS, browser, locale etc.).</p>
Test Coverage	<p>Defined as the extent to which testing covers the product's complete functionality. This metric is an indication of the completeness of the testing. It does not indicate anything about the effectiveness of the testing. This can be used as a criterion to stop testing. Coverage could be with respect to requirements, functional topic list,</p>

	business flows, use cases, etc. It can be calculated based on the number of items that were covered vs. the total number of items.
Test Effort Percentage	The effort spent in testing, in relation to the effort spent in the development activities, will give us an indication of the level of investment in testing. This information can also be used to estimate similar projects in the future. This metric can be computed by dividing the overall test effort by the total project effort.
Traceability Metric	Traceability is the ability to determine that each feature has a source in requirements and each requirement has a corresponding implemented feature. This is useful in assessing the test coverage details.
Scope Changes	The number of changes that were made to the test scope (scope creep). indicates requirements stability or volatility, as well as process stability. Ratio of the number of changed items in the test scope to the total number of items
Task Tracking Efficiency Index (TTEI)	This index indicates the average time taken to attend to general project tasks. $TTEI = \frac{\sum \text{Time taken to attend task}}{\sum \text{open task}}$

2.2 Metrics Analysis

Much as the time is spent gathering or maintaining metrics, enough time should be spent to review and interpret on a regular basis throughout the test effort, particularly after the application is released into production. During review meetings, the project team should closely examine all available data and use that information to determine the root cause of identified problems. It is important to look at several metrics, as this will allow the project team to have a more complete picture of what took place during a test.

Let's assume that as part of the SPA Process, the following metrics are collected by the SPA team.

Metric	Purpose
Defect Severity Index	Weighted average index of the Severity of defects. A higher severity defect gets a higher weight. S1 is a show stopper, S2 is high severity, S3 is medium & S4 is low. Ideally, this should slope down as test cycles progress.

For instance, if the test team has generated the following metrics:

Looking the graphs one can safely deduce the followings; **Defect Severity Index Trend:**

What does the graph indicate? The defect severity index is sloping down consistently. This indicates an increasingly favorable trend. As the test cycle progresses (from cycle 1 to cycle 10), the severity index is sloping which suggests increasing quality of the application (as lesser number of critical and high severity defects are being reported).

This is what it could mean: While a fall in the defect severity index is definitely a good trend, looking at this index in isolation could be misleading. Following factors need to be considered in order to have a meaningful analysis.

Number of defects logged - let us consider an example where the test team executed two cycles of testing (assuming other things as constant). The number of defects logged against each of these cycles along with the calculated severity index is shown below.

Number of Defects		
Defect Severity	Cycle 1(# of defects)	Cycle 2(# of defects)
s1	5	5
s2	10	15
s3	50	30
s4	100	100
Severity Index	1.52	1.50

At first thoughts, when we compare cycle 1's Severity Index with cycle 2's Severity Index, cycle 2 looks to be favorable (as the severity index is lower). If you go into the details of the number of defects logged and their severity, the picture turns out to be the opposite. While the total number of Severity 1 and Severity 2 defects for cycle 1 is 15, the number of Severity 1 and Severity 2 defects for cycle 2 is 20. In terms of quality, cycle 1 is better than cycle 2 as cycle 1 has lesser number of high severity defects (though the total number of defects logged in cycle 1 is more than cycle 2 defects and the severity index is greater than cycle 2 severity index). Test coverage has a similar impact. A lower test coverage coupled with reducing severity index would not be a healthy trend.

Severity of Defects		
Defect Severity	Cycle 1(# of defects)	Cycle 2(# of defects)
s1	4	0
s2	4	0
s3	42	75
s4	27	2
Severity Index	1.81	2.03

- Defect Severity - let's consider another example where the test team executed two cycles of testing (assuming other things as constant). The severity of defects logged against each of these cycles along with the calculated severity index is shown below.

Looking at the severity index, it looks like cycle 1 is better than cycle 2 (as the severity index is low for cycle 1 compared to cycle 2). However, cycle 2 is better than cycle 1 as total number of Severity 1 and Severity 2 defects is zero compared to a total of 8 severity 1 and severity 2 defects of cycle 1. Just because the severity index is low, do not believe the quality of the application is better than the earlier cycle.

3. . Process Automation

In following section describes about the testing methodologies, process and tools to be used while automating the typical software development life-cycle in order to deriving the metrics.

3.1 Testing Methodology

According to the automated testing process, every development activity is mirrored by a test activity. The testing process follows a well-proven testing methodology called W-model. Following Figure-2.0 explains, the way of testing activities of W-model involve with the standard software development life-cycle.

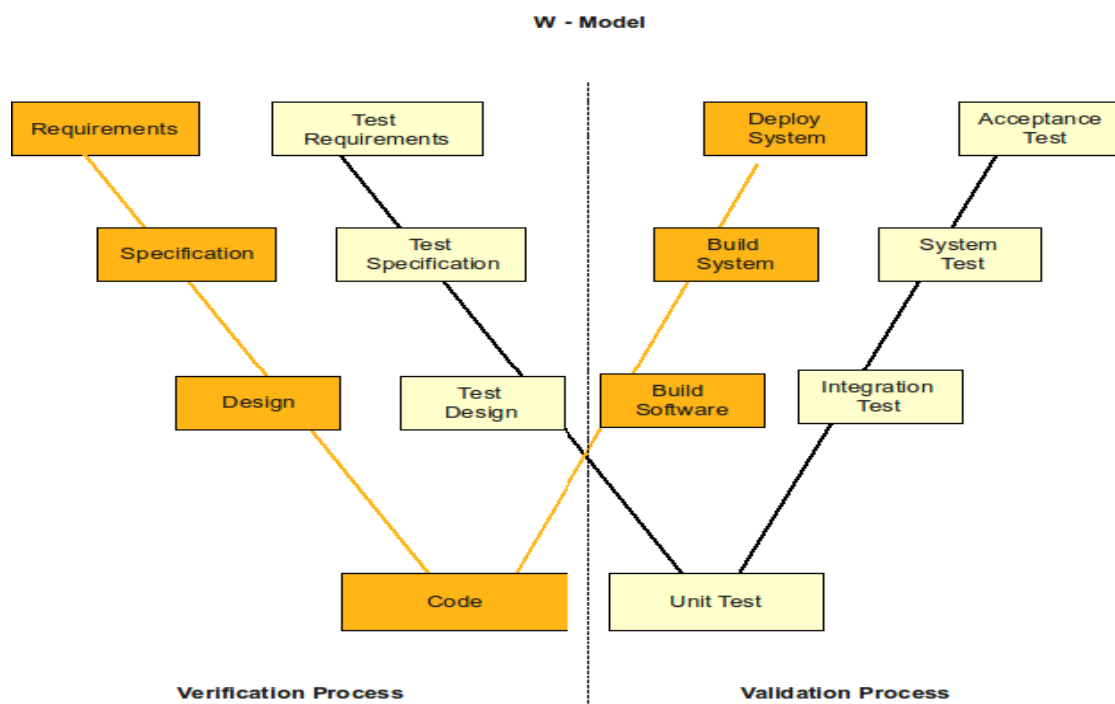

Figure 2.0 – The W-model

While the execution of the project, either developers or SPA team can generate the related metrics.

3.2 Skills required to generate Metrics

During the different stages of a software project, several roles and parties will be involved with development, reviewing and testing activities. In Figure 3.0 shows the different stages of a software project, the main activities which should perform during those stages, the roles/parties should involve and the metrics which derive and maintain in those stages.

Stage	Inception	Requirements	Architecture	Detail Design	Coding	Testing	System Integration	UAT	OAT
Activity	Review Test Plan & Project Plan	Requirement Verification	Architectural Review	Detail Design Review & Review Test Cases	Code Review	Unit Testing & Functional Testing	Performance Testing, Integration Testing & Security Testing	User Acceptance Testing	Operational Acceptance Testing
Index	PERI	RCI	AQI & RCI	DQI, DD & RCI	CQI, DSI, DD & RCI	DSI, DD, RCI & UT Report	Performance Test Results, Security Test results	RCI, ISI & UAT Report	ISI & OAT Report
Skills Required	QA Lead	Business Analyst & Architect	Architect	Designer & Architect	Code Reviewer	QA Team & Code Reviewer (Engineers)	QA Team / Engineers	Project Owner(Client)	Project Manager

Figure 3.0 - Skills required to generate Metric

3.3 Process of Setting-up a Metric

The Figure-4.0 explains the life-cycle of a Metric or the process involved in setting up the metrics:

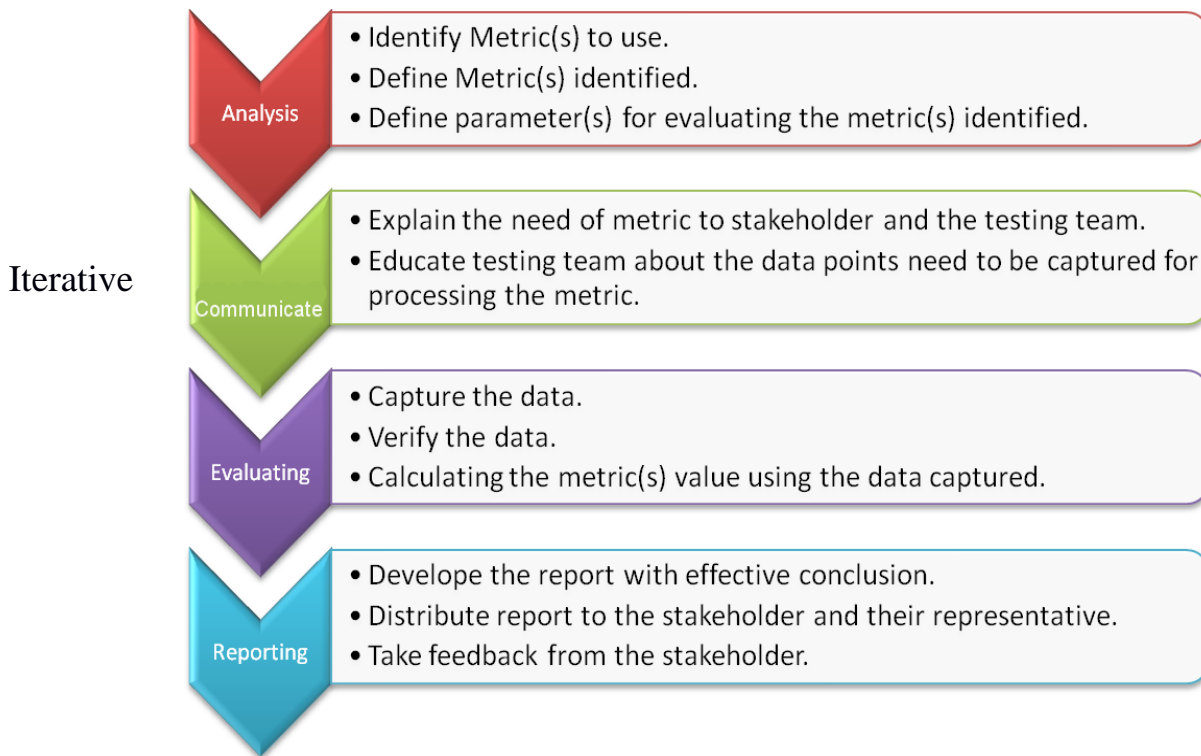

Figure 4.0 - Metrics Life-Cycle

When implementing this process, several testing tools and techniques will be used along with the automated testing process in order to generating, maintaining and evaluating the metrics derived at specific level of the Software development life-cycle.

3.4 Integration of testing tools/process

Below you find a list of tools /process which will be used when automating the typical SD life-cycle suits to the Software Project Audit Process.

- **Fagan inspection** - Fagan Inspection defines a process as a certain activity with a pre-specified entry and exit criteria. Activities for which Fagan Inspection can be used are:

1. Requirement specification
2. Software/Information System architecture (for example DYA)
3. Programming (for example for iterations in XP or DSDM)
4. Software testing (for example when creating test scripts)

- **Cruise Control** – It is both a continuous integration tool and an extensible framework for creating a custom continuous build process. It includes dozens of plug-ins for a variety of source controls, build technologies, and notifications schemes including email and instant messaging. A web interface provides details of the current and previous builds.
- **Bug-zilla** - It is a Web-based general-purpose defect tracking and testing tool.
- **SVN** - It is a revision control system which use Subversion to maintain current and historical versions of files such as source code, web pages, and documentation.
- **Git** - Git is a **free & open source, distributed version control system** designed to handle everything from small to very large projects with speed and efficiency.
- **SCM** - For Configuration identification and Identifying configurations, configuration items and baselines. Also for Configuration control ,Configuration status accounting and Configuration auditing

3.5 Displaying Metrics –The Dashboard

The Dashboard is the interface to help project teams to visualize their project statuses by several indexes. And also it could be used to displaying the test results of specific tests carried by the SPA team who responsible for the given project. As an example; in Figure 5.0 displays the current status of the project with its estimated effort against the predicted effort.
